

a Allele observations from one alignment

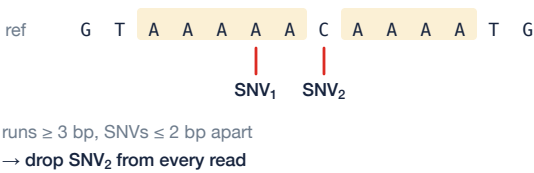

observation quality entering the edge weight

class	source	weight
SNV	aligned base, Phred Q	1 if both bases $\geq$ Q12, else 0.1
indel	CIGAR I/D at the site	1; 0.1 if in a tandem repeat
SV	caller read list	1 for ALT, 0.1 for REF
5mC	modcall read lists	1, strand matched

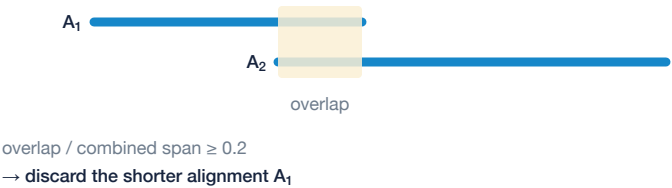

d Tandem-repeat indel flag

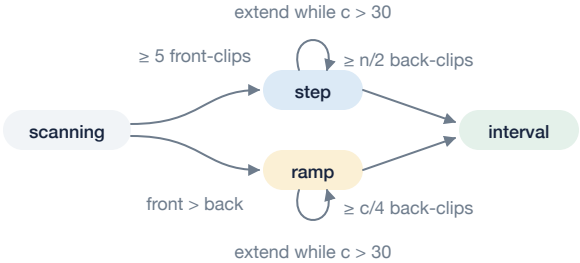

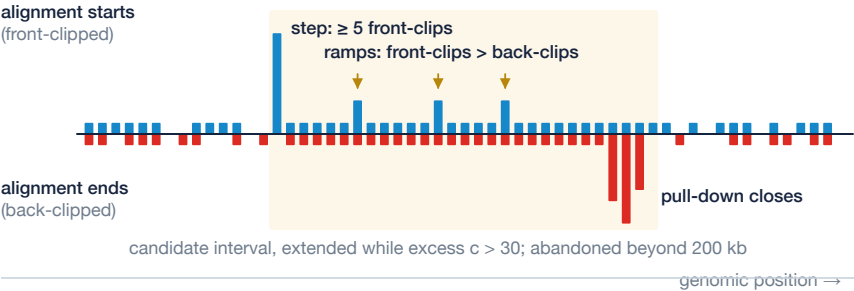

b Homopolymer SNV filter (nanopore, --ont)

c Overlapping-alignment filter

e Copy-number-aware filter: interval detection

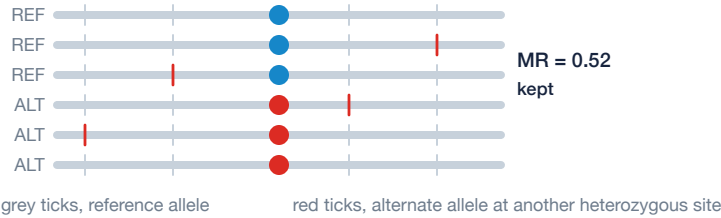

f Copy-number-aware filter: site removal

MR = $\frac{\text{mean } R_m(\text{ALT})}{\text{mean } R_m(\text{REF}) + \text{mean } R_m(\text{ALT})} \geq 0.7 \rightarrow \text{remove the site from every read}$

R_m = alternate alleles a read carries at other sites inside the interval

true heterozygous site

parologue-specific difference

g Order of operations
