

a Clipping-based detection of copy-number-altered intervals

b Removing heterozygous calls whose ALT reads carry the mismatches

Variant inside interval; other heterozygous sites on the same reads shown as ticks

mean mismatches per read

REF-supporting reads: 0.7

ALT-supporting reads: 4.7

ratio = $\text{ALT} / (\text{REF} + \text{ALT}) = 0.87 \geq 0.7$

→ site removed from all reads before graph construction

Targets heterozygous calls created by collapsed paralogues or copy-number change, whose ALT allele co-occurs with a paralogue-specific mismatch pattern.
