

a Step 1 — assign each read to a haplotype

tagged if $\max(n_1, n_2) / (n_1 + n_2) > 0.65$ and weighted evidence > 1

allele weights: SNV 1, SV 1, indel 0.1, 5mC 0 (so ≥ 2 SNV/SV alleles are needed)

b Step 2 — re-derive each variant's phase from tagged reads

variant v₃

variant v₁
